INTRODUCTION

The Student Registration Form is a web-based application developed using HTML, CSS, and JavaScript. The main purpose of this form is to collect and organize important student information such as Registration ID, Name, Gender, Date of Birth, Email ID, Phone Number, Department, Course, College, Address, and Resume. HTML is used to create the basic structure and different input fields of the registration form.

CSS is used to improve the appearance and presentation of the form. It provides a professional design using gradients, borders, shadows, rounded corners, responsive layouts, and styled buttons. The form is designed to adjust properly on different screen sizes such as desktops, tablets, and mobile devices.

JavaScript is used to provide form validation and user interaction. It checks whether all mandatory fields have been completed before submission. If any field is empty, an appropriate error message is displayed and the incomplete field is highlighted. Once all required information is entered correctly, a success message is displayed. The reset option also clears the validation and success messages.

Thus, this project demonstrates how HTML, CSS, and JavaScript can be combined to create a user-friendly and responsive student registration form.

CONCLUSION

The Student Registration Form successfully demonstrates the implementation of a structured and interactive web form using HTML, CSS, and JavaScript. HTML provides the necessary form elements for collecting student details, while CSS gives the application an attractive and professional appearance. The responsive design also ensures that the form can be viewed conveniently on different devices and screen sizes.

JavaScript enhances the functionality of the form by performing client-side validation. It identifies incomplete mandatory fields, displays suitable error messages, highlights invalid fields, and prevents submission until the required information is provided. After successful completion, the user receives a confirmation message, while the reset button allows the form to be cleared easily.

Overall, this project provides practical knowledge of front-end web development and demonstrates the importance of combining structure, design, and functionality in a web application. The Student Registration Form can also be further improved in the future by connecting it to a database, adding stronger validation, and storing submitted student information securely.
